I. Background

On February 14, 2020, the head of the WHO Health Emergencies Programme posited that smoking is a risk factor for the severity of any lower respiratory tract infection, and that the same would be expected in COVID-19, a respiratory disease. To identify smokers as a potential vulnerable group for COVID-19, health experts have subsequently called for outright quitting of smoking in Indonesia (WHO), Israel (Israeli Medical Association for Smoking Cessation and Prevention), Japan (Tokyo Medical Association), Ireland (Health Service Executive), and South Africa (National Council Against Smoking [NCAS]). To avoid COVID-19 transmission, some countries in the Eastern Mediterranean Region have banned the use of shisha in public places.

On March 2, 2020, when the New York City mayor announced that smoking or vaping makes people “more vulnerable to suffer” with COVID-19 and encouraged individuals to quit, authors/publishers with links to Philip Morris International (PMI) or the PMI-funded Foundation for a Smoke-Free World (FSFW) actively challenged the same. They also reacted negatively to an expert who warned against the dangers of vaping during the coronavirus outbreak by asserting that those inhaling the fumes produced by the cigarette substitute is equivalent to “someone spitting in your face.” On March 16, 2020, an article published by Reason, an organization with known links to PMI, stated that the US Center for Disease Control and Prevention’s (CDC) “scaremongering about e-cigarettes undermined its credibility on the eve of a true public health crisis (referring to COVID-19).”

Scientists have opined that the “COVID-19 epidemic provides a ‘teachable moment’ in which smokers may be uniquely receptive to stop smoking advice” and that “it is plausible that a spike in quit rates could help reduce community transmission of SARS-CoV-2.” However, an analysis of the tobacco industry’s public relations and social media responses reveals that it is utilizing the global COVID-19 crisis to promote “switching” (to heated tobacco) or vaping and condemning those who call for outright quitting (see Annex 1). To this end, it has even propagated the speculation that the “antiviral” and “antibacterial” properties of a vape ingredient could be beneficial to curb COVID-19 transmission. It has also taken the opportunity to market its stocks, ensure continuous availability of its products despite the lockdowns, encourage stocking-up on vaping supplies/novel tobacco products, and even provide discounts for the same.
tobacco industry has also reportedly approached policymakers in low- and middle-income countries to offer so-called “donations”, while at the same time, seeking favors to ensure continuous delivery of its products during the lockdown.32

II. Issue

The tobacco epidemic kills 8 million people annually.33 Because of the tobacco industry’s role in the epidemic, it is subject of a global treaty, the WHO Framework Convention on Tobacco Control (WHO FCTC),34 with over 180 Parties. To date, it is the only industry that a treaty law requires to be strictly monitored.35 Because of tobacco’s adverse impacts on health, environment, and economy, the WHO FCTC is now embedded in the United Nations Sustainable Development Goals (UN SDGs), enshrining the tenet that good governance in public health involves treating tobacco companies differently from the rest of industry.36

While the COVID-19 crisis presents an opportunity to encourage the world’s smokers to quit smoking outright, including quitting cold turkey, the tobacco industry is taking the opportunity to counter this by camouflaging the links between tobacco and COVID-19; and promoting vaping products or heated tobacco, even when there is no evidence that these products are safe in the context of transmitting or acquiring COVID-19.

While governments can seize the opportunity to save more lives than COVID-19 can take, the tobacco industry is poised to undermine governments’ credibility and ability to do so by “partnering with” or “donating to” them in the guise of so-called “corporate social responsibility,” and shifting public attention towards the use of vaping products and heated tobacco.

III. Recommendations

1. Use the COVID-19 crisis to urge smokers to quit outright

Smokers are more vulnerable to influenza as well as the corona virus that causes the Middle East Respiratory Syndrome (MERS). 37 38 Once infected with COVID-19, smokers are likely to suffer more serious conditions 39 that could lead to premature deaths.

The disease progression of smokers with COVID-19 demonstrates what the adverse effects of smoking look like when there is no latency period. This makes the harms of smoking more real, and makes the urgency to quit more imminent. Quarantine and lockdown regulations instill an environment that fosters health and safety, leaving less room for harmful practices such as smoking. There is widespread concern over the under-capacity of healthcare systems and personnel to address COVID-19; and this provides further motivation to maintain healthy practices, especially to those who are concerned that treatment of smoking-related or smoking-aggravated diseases puts undue strains on healthcare systems.
Hence, a growing number of governments and health experts see the COVID-19 crisis as an opportunity to encourage over 1 billion smokers in the world to quit smoking outright, in order to reduce the 8 million deaths annually.

**COVID-19 and SMOKING**

Smoking can increase your risk of developing severe disease if you become infected with COVID-19.

—WHO Director General, March 20, 2020

A systematic review of evidence shows that based on limited data “smoking is most likely associated with the negative progression and adverse outcomes of COVID-19;” and based on the largest study, the authors calculated that “smokers were 1.4 times more likely ...to have severe symptoms of COVID-19 and approximately 2.4 times more likely to be admitted to an intensive care unit (ICU), need mechanical ventilation or die compared to non-smokers.” The paper also cited previous studies showing “that smokers are twice more likely than non-smokers to contract influenza and have more severe symptoms, while smokers were also noted to have higher mortality in the previous MERS-CoV outbreak.”

As to vaping and use of heated tobacco products (HTPs), while no evidence exists to directly link COVID-19 risks, there are also no studies that show the safety of vaping or use of HTPs in the context of COVID-19. Nevertheless, there is a study showing vaping-related damage to parts of the respiratory system (in terms of immune suppression and inflammatory response in nasal cells).

2. **Raise awareness about the tobacco industry and its tactics and reject its approaches**

As part of treaty obligations, WHO FCTC Parties are required to encourage quitting and to protect their respective tobacco control measures from the commercial and vested interests of the tobacco industry (Article 5.3); and the Guidelines for the Implementation of Article 5.3 recommend that Parties raise awareness about tobacco industry tactics. Tobacco companies must be monitored and their tactics exposed in accordance with treaty guidelines because their corporate behavior resulted in the tobacco epidemic that kills 8 million people annually. Hence, partnerships with the tobacco industry could erode governments’ credibility in upholding public health and in delivering anti-smoking messages in the time of COVID-19.

COVID-19 also highlights the affliction caused by tobacco products to society, and provides a sharp contrast to tobacco companies’ claims of being “partners in development.” Yet, the tobacco industry, despite its claims of having “transformed and committed to make smokers quit,” downplays the role of smoking in COVID-19, questions those calling for outright quitting of smoking, and paves the way to promote the use of novel tobacco and nicotine products (i.e., vaping devices and heated tobacco products). Further, tobacco companies’ messages to investors reveal the industry strategy to further grow alternative addictive products in order to offset investment declines. Finally, the tobacco industry uses “public relations” activities such as “partnerships” and “donations” to enhance its corporate image to enable itself to better market its addictive products including in a manner that attracts children.
3. **Hold the tobacco industry accountable for harms and deaths suffered by smokers including those suffering from COVID-19**

The COVID-19 pandemic magnifies the liability of the tobacco industry in inducing smokers to use its addictive products. The science linking the health harms, including respiratory damage, to tobacco products is robust, but the tobacco industry has yet to be made accountable for the global scourge.

Tobacco manufacturers can be made accountable for harms suffered and deaths caused by its products and/or its behavior; based on either consumer / product liability laws, or equity and justice provisions in laws that exist in many countries. WHO FCTC Article 19 encourages Parties to strengthen legal and court procedures to facilitate lawsuits against the tobacco industry, while establishing mechanisms for international cooperation. Governments must take the opportunity to exhaust means to recover healthcare costs of tobacco-related harms from large tobacco manufacturers (e.g., cases filed in Canada, Nigeria, South Korea, and United States); and explore other means to make them accountable, including by imposing taxes and surcharges to compensate victims and governments for the massive harms caused.

The Influence Foundation which operates Filter, has received restricted and unrestricted grants, respectively, from KAC and FSFW.”

62 Supra note 59. – “Now, the Foundation is similarly funding media outlets, with $190,000 allocated to Filter Magazine for ‘feature-length pieces of written and original videos.’

63 Supra note 20. – “Current use of e-cigarettes appears to be an independent risk factor for respiratory disease in addition to all combustible tobacco smoking... high prevalence of dual use, which is associated with increased risk beyond combustible tobacco use. – Bhatta, D and Glantz, S.”...“Dr. Alex Wodak, an addiction medicine physician, prominent drug policy reform advocate and board member of the Australian Tobacco Harm Reduction Association, raised this question in a February 27 email to colleagues…we are in ‘uncharted territory’ when it comes to determining any efficacy of tobacco harm reduction in curtailting COVID-19. He pointed out that public health authorities in a number of countries are recommending that people refrain from smoking to reduce their risks of infection, ‘leaving the public in the dark as to whether use of these products is safe or not.’”

64 Bhatta D & Glantz S (2019). Association of E-Cigarette Use with Respiratory Disease among Adults: A Longitudinal Analysis. American Journal of Preventive Medicine. Vol. 58, Issue 2, pp. 182-190. Retrieved from https://www.ajpmonline.org/article/50749-3797/1930391-5/fulltext (accessed on 20 March 2020). – The author based its argument on Bhatta & Glantz’s article that mentions a theoretical reduced risk of respiratory infections for vapers vis-a-vis smokers, when this was mentioned in the context of challenging the value of the alleged theoretical risk reduction due to dual use (use of both vaping devices and cigarettes)—not to prove the matter. “Conclusions: Use of e-cigarettes is an independent risk factor for respiratory disease in addition to combustible tobacco smoke use alone. The current finding suggests that e-cigarette use, the most common use patterns, is riskier than other product alone.”

65 Supra note 20. – “The fast-developing situation with COVID-19 requires public health authorities to make decisions without the benefit of substantial evidence, but balanced communications are essential. The far more predictable health harms of smoking continue to contrast with the substantial relative benefits of switching to risk-reduced nicotine products (of which some, such as oral snus, have no known respiratory impact). If that key message—already denied by the WHO and many others—were to be further obscured by stop-vaping calls amid the COVID-19 crisis, there’s every likelihood that it will further exacerbate the harms of this outbreak.”
